Subsetting Data in R

Data Wrangling in R

Subsetting part 2

Data

A tibble: 6 x 10

Let's continue to work with the Diamond dataset from the ggplot2 package of the tidyverse.

We will often use the glimpse() function of the dplyr package of the tidyverse to look at a rotated view of the data.

```
library(tidyverse)
head(diamonds)
```

```

Let's learn more about this data

We can use ?diamonds to get more informatin in the Help pane.

We might decide to rename some columns,

- ▶ x to be length
- y to be width
- z to be depth
- but first changing depth to be depth_percentage

Renaming Columns of a data frame or tibble

To rename columns in dplyr, you can use the rename function.

Notice the new name is listed first!

3 0.23 Good E VS1

56.9 65 327

More Renaming

```

\$ depth_percentage <dbl> 61.5, 59.8, 56.9, 62.4, 63.3, 62.8

<dbl> 55, 61, 65, 58, 58, 57, 57, 55, 63

<int> 326, 326, 327, 334, 335, 336, 336

<dbl> 3.95, 3.89, 4.05, 4.20, 4.34, 3.94

<dbl> 3.98, 3.84, 4.07, 4.23, 4.35, 3.96

Take Care with Column Names

When you can, avoid spaces, special punctuation, or numbers in column names, as these require special treatment to refer to them.

See https://jhudatascience.org/intro_to_r/quotes_vs_backticks.html for more guidance.

```
diamonds %>% rename(depth percentage = depth) # this will condition diamonds %>% rename(depth_percentage = depth) # this will a
```

diamonds %>% rename(`depth percentage` = depth) # not record

Unusual Column Names

It's best to avoid unusual column names where possible, as things get tricky later.

We just showed the use of 'backticks'. You may see people use quotes as well.

Other atypical column names are those with:

- spaces
- number without characters
- number starting the name
- other punctuation marks (besides "_" or ":" and not at the beginning)

Rename tricky column names so that you don't have to deal with them later!

Example

glimpse(diamonds_bad_names)

A tibble: 53,940 x 10

```
Rows: 53,940
Columns: 10
                         <dbl> 0.23, 0.21, 0.23, 0.29, 0.3
$ carat
$ cut
                         <ord> Ideal, Premium, Good, Premium
                         <ord> E, E, E, I, J, J, I, H, E, I
$ color
$ clarity
                         <ord> SI2, SI1, VS1, VS2, SI2, VVS
$ depth
                         <dbl> 61.5, 59.8, 56.9, 62.4, 63.3
                         <dbl> 55, 61, 65, 58, 58, 57, 57,
$ table
$ `Price(in US dollars)` <int> 326, 326, 327, 334, 335, 336
$ `Length (in mm)` <dbl> 3.95, 3.89, 4.05, 4.20, 4.34
$ `Width in mm`
                        <dbl> 3.98, 3.84, 4.07, 4.23, 4.39
$ `Depth percentage` <dbl> 2.43, 2.31, 2.31, 2.63, 2.79
diamonds_bad_names %>%
        rename(price = `Price(in US dollars)`)
```

Renaming all columns of a data frame: dplyr

To rename all columns you use the rename_with(). In this case we will use toupper() to make all letters upper case. Could also use tolower() function.

diamonds upper <- diamonds %>% rename with(toupper) head(diamonds upper, 2)

```
# A tibble: 2 \times 10
```

                                                                                                               <dbl> 3.98, 3.84, 4.07, 4.23, 4.35, 3
$ depth_percentage
                                                                                                              <dbl> 2.43, 2.31, 2.31, 2.63, 2.75, 3
```

Subset based on a class

The where() function can help select columns of a specific class

head(diamonds, 2)

A tibble: 2 x 10

 $\verb"is.character"() and \verb"is.numeric"() are often the most helpful$

2 0.21 59.8 61 326 3.89 3.84 2.31

The where() function can help select columns of a specific class

 $\verb"is.character"() and \verb"is.numeric"() are often the most helpful$

distinct() function

To filter for distinct values from a variable, multiple variables, or an entire tibble you can use the distinct() function from the dplyr package. Similar to count, but without the number of times the value shows up.

distinct(diamonds, cut)

```
# A tibble: 5 x 1
  cut
  <ord>
1 Ideal
Premium
3 Good
```

4 Very Good 5 Fair

Adding/Removing Columns

Adding columns to a data frame: dplyr (tidyverse way) The mutate function in dplyr allows you to add or modify columns

```
of a data frame.
# General format - Not the code!
{data object to update} <- {data to use} %>%
                         mutate({new variable name} = {new variable name} = {new variable name}
```

1 US dollar = 1.32 Canadian dollars diamonds %>%

\$ depth

\$ table

```
mutate(price_canadian = price * 1.32) %>% glimpse()
Rows: 53,940
```

Columns: 11

\$ carat <dbl> 0.23, 0.21, 0.23, 0.29, 0.31, 0.24,

\$ cut <ord> Ideal, Premium, Good, Premium, Good</br>

\$ color <ord> E, E, E, I, J, J, I, H, E, H, J, J,

\$ clarity <ord> SI2, SI1, VS1, VS2, SI2, VVS2, VVS1

<dbl> 61.5, 59.8, 56.9, 62.4, 63.3, 62.8,

<dbl> 55, 61, 65, 58, 58, 57, 57, 55, 61,

Use mutate to modify existing columns

The mutate function in dplyr allows you to add or modify columns of a data frame.

mutate(diamonds, price = price * 1.32) %>% glimpse()

```
Rows: 53,940
Columns: 10
```

\$ x

<dbl> 3.95, 3.89, 4.05, 4.20, 4.34, 3.94, 3.95, 4

remember to save your data

If you want to actually make the change you need to reassign the

```
data object.
```

diamonds <- diamonds %>% mutate(price = price * 1.32) %>% y

Removing columns of a data frame: dplyr

select(diamonds, - price) %>% glimpse()

The select function can remove a column with minus (-)

\$ clarity <ord> SI2, SI1, VS1, VS2, SI2, VVS2, VVS1, SI1, V

Or, you can simply select the columns you want to keep, ignoring the ones you want to remove.

Removing columns in a data frame: dplyr

You can use c() to list the columns to remove.

Remove newcol and drat:

```
select(diamonds, -c("x", "y", "z")) %>% glimpse()
Rows: 53,940
Columns: 7
$ carat <dbl> 0.23, 0.21, 0.23, 0.29, 0.31, 0.24, 0.24,
$ cut <ord> Ideal, Premium, Good, Premium, Good, Very (
$ color <ord> E, E, E, I, J, J, I, H, E, H, J, J, F, J, I
$ clarity <ord> SI2, SI1, VS1, VS2, SI2, VVS2, VVS1, SI1, V
$ depth <dbl> 61.5, 59.8, 56.9, 62.4, 63.3, 62.8, 62.3, 63.3, 63.8, 63.3, 63.8, 63.3, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8, 63.8
$ table <dbl> 55, 61, 65, 58, 58, 57, 57, 55, 61, 61, 55
$ price <int> 326, 326, 327, 334, 335, 336, 336, 337, 33
```

Ordering columns

The select function can reorder columns.

326 61.5 0.23 Ideal E

326 59.8 0.21 Premium E

2

```
head(diamonds, n = 2)
# A tibble: 2 x 10
 carat cut color clarity depth table price x
 <dbl> <ord> <ord> <dbl> <dbl> <int> <dbl> <dbl> <dbl> <
1 0.23 Ideal E SI2 61.5 55 326 3.95 3.98
2 0.21 Premium E SI1
                          59.8 61 326 3.89 3.84
diamonds %>% select(price, depth, carat, cut, color) %>% he
# A tibble: 2 x 5
 price depth carat cut color
 <int> <dbl> <ord> <ord>
```

2

The select function can reorder columns. Put price first, then select the rest of columns:

```
head(diamonds, n = 2)
# A tibble: 2 x 10
  carat cut color clarity depth table price x
  <dbl> <ord> <ord> <dbl> <dbl> <int> <dbl> <dbl> <dbl> <
1 0.23 Ideal E SI2 61.5 55 326 3.95 3.98
2 0.21 Premium E SI1
                           59.8 61 326 3.89 3.84
diamonds %>% select(price, everything()) %>% head(n = 2)
# A tibble: 2 x 10
 price carat cut color clarity depth table x
  <int> <dbl> <ord> <ord> <dbl> <dbl> <dbl> <dbl> <dbl> <dbl> <
```

326 0.23 Ideal E SI2 61.5 55 3.95 3.98

326 0.21 Premium E SI1 59.8 61 3.89 3.84

head(diamonds, n = 2)

Put price at the end ("remove, everything, then add back in"):

In addition to select we can also use the relocate() function of dplyr to rearrange the columns for more complicated moves.

For example, let say we just wanted price to be before carat.

```
head(diamonds, n = 2)
```

```
# A tibble: 2 x 10
```

carat cut color clarity depth table price x

```
<dbl> <ord> <ord> <dbl> <dbl> <int> <dbl> <dbl> <int> <dbl> <
```

```
1 0.23 Ideal E
               SI2 61.5 55 326 3.95 3.98
```

2 0.21 326 Premium E

```
diamonds %>% relocate( price, .before = cut) %>% head(n = 5
```

A tibble: 2 x 10

carat price cut color clarity depth table x

<dbl> <int> <ord> <ord> <dbl> <dbl> <dbl> <dbl> <dbl> < 1 0.23 326 Ideal E SI2 61.5 55 3.95 3.98

SI1

59.8

61 3.89 3.84

```
Ordering the column names of a data frame: alphabetically
   Using the base R order() function.
```

```
order(colnames(diamonds))
```

X

Summary

- select() and relocate() can be used to reorder columns
- arrange() can be used to reorder rows
- can arrange in descending order with desc()
- can remove rows with filter()
- can remove a column in a few ways:
 - using select() with negative sign in front of column name(s)
 - jut not selecting it
- mutate() can be used to modify an exisiting variable or make a new variable
