Introduction to Bioconductor

Data Wrangling in R

The Bioconductor project

- <u>Bioconductor</u> is an open source, open development software project to provide tools for the analysis and comprehension of high-throughput genomic data. It is based primarily on the R programming language.
- Most Bioconductor components are distributed as R packages. The functional scope of Bioconductor packages includes the analysis of microarray, sequencing, flow sorting, genotype/SNP, and other data.

Project Goals

The broad goals of the Bioconductor project are:

- To provide widespread access to a broad range of powerful statistical and graphical methods for the analysis of genomic data.
- To facilitate the inclusion of biological metadata in the analysis of genomic data, e.g. literature data from PubMed, annotation data from Entrez genes.
- To provide a common software platform that enables the rapid development and deployment of extensible, scalable, and interoperable software.
- To further scientific understanding by producing high-quality documentation and reproducible research.
- To train researchers on computational and statistical methods for the analysis of genomic data.

Quick overview of the website

- biocViews
- Support site
- · Teaching material
- Installation

Getting started

```
# Note that this is not evaluated here, so you will have to do it before using this knitr doc
install.packages("BiocManager")
# Install all core packages and update all installed packages
BiocManager::install()
```

Getting started

You can also install specific packages

```
# Note that this is not evaluated here, so you will have to do it before using this knitr doc
BiocManager::install(c("GEOquery", "limma", "biomaRt", "SummarizedExperiment"))
```

Bioconductor Workflows

https://bioconductor.org/packages/release/workflows/vignettes/sequencing/inst/doc/s

The Gene Expression Omnibus (GEO)

The <u>Gene Expression Omnibus</u> is an international public repository that archives and freely distributes microarray, next-generation sequencing, and other forms of high-throughput functional genomics data submitted by the research community.

The three main goals of GEO are to:

- Provide a robust, versatile database in which to efficiently store highthroughput functional genomic data
- Offer simple submission procedures and formats that support complete and well-annotated data deposits from the research community
- Provide user-friendly mechanisms that allow users to query, locate, review and download studies and gene expression profiles of interest

For individual studies/datasets, the easiest way to find publicly-available data is the GEO accession number found at the end of publications.

The GEOquery package can access GEO directly.

https://www.bioconductor.org/packages/release/bioc/html/GEOquery.html

```
library (GEOquery)
## Setting options('download.file.method.GEOquery'='auto')
## Setting options ('GEOquery.inmemory.gpl'=FALSE)
# https://pubmed.ncbi.nlm.nih.gov/32619517/
geo data = getGEO("GSE146760")[[1]] # find accession in paper
## Found 1 file(s)
## GSE146760 series matrix.txt.gz
##
## — Column specification ·
## cols(
    ID REF = col character(),
                                                                                        10/24
```

We can get the phenotypic data using the pData() function from Biobase

```
tibble(Biobase::pData(geo data))
```

```
## # A tibble: 11 x 44
##
    title
                 geo accession status submission date last update date type

11/24

Actual gene expression data, ie RNA-seq read counts, is less commonly stored in GEO.

Wh

```
Biobase::exprs(geo_data) # gene expression

## GSM4405470 GSM4405471 GSM4405472 GSM4405473 GSM4405474 GSM4405475

## GSM4405476 GSM4405477 GSM4405478 GSM4405479 GSM4405480

Biobase::fData(geo_data) # gene/feature/row annotation

## data frame with 0 columns and 0 rows
```

Sometimes the gene expression matrices are stored as supplementary data. We can check it out using the GEOquery package.

https://www.ncbi.nlm.nih.gov/geo/query/acc.cgi?acc=GSE146760

getGEOSuppFiles("GSE146760")

```

```

OK! so now we can start working with our data... first, we want to make sure these two files have all the same corresponding sample IDs. We want the pheno\$Prefix column to be the same as the colnames of our count data. This is going to take some wrangling!

```
#colnames(counts) = sapply(str_split(colnames(counts), "Aligned"), "[[", 1)
colnames(counts) = str_remove(string = colnames(counts), pattern = "Aligned.sortedByCoord.out.k
identical(colnames(counts), pheno$Prefix)
```

```
## [1] TRUE
```

OK could be a bit more clear

Now that we know they are identical, let's replace the column names of counts with the Status column values of pheno.

```
rownames(pheno) = pheno$Status
colnames(counts) = pheno$Status
```

SummarizedExperiment objects are probably the standard data structure for gene expression data.

https://bioconductor.org/packages/release/bioc/html/SummarizedExperiment.html

biomaRt

We can also add gene annotation information with the biomart package.

Guide: https://www.bioconductor.org/packages/devel/bioc/vignettes/biomaRt/inst/doc/

```
library(biomaRt)

if (interactive()) {
  listEnsembl()
}

#datasets <- listDatasets(ensembl)
#head(datasets)
#searchAttributes(mart = ensembl, pattern = "hgnc")</pre>
```

biomaRt

Guide: https://www.bioconductor.org/packages/devel/bioc/vignettes/biomaRt/inst/doc/

Biomart

head (geneMap)

```
ensembl gene id chromosome name start position end position strand

geneMap gr = geneMap gr[mm[!is.na(mm)]]
counts = counts[!is.na(mm),]
```

Summarized Experiments

Getting data from the Sequence Read Archive (SRA)

GEO originated for microarray data, which has largely become replaced by data produced using next-generation sequencing technologies. Depositing raw sequencing reads into the Sequence Read Archive (SRA) is often a condition of publication in many journals.

https://trace.ncbi.nlm.nih.gov/Traces/sra/?study=SRP044749

Raw data is annoying to process into gene counts

So we created the recount project https://jhubiostatistics.shinyapps.io/recount/

```
source("scale_counts.R") # or install recount package
load(file.path('SRP044749', 'rse_gene.Rdata'))
rse_gene = scale_counts(rse_gene)
rse_gene
