Reading data with the googlesheets4 package

First, set up Google credentials.

```
library(googlesheets4)
```

```
# Prompts a browser pop-up  
gs4_auth()
```

When prompted:

- “OK to cache OAuth access credentials in the folder between R sessions?”, select YES
- Make sure you select “allow” on your Google Account for the Tidyverse API.

Reading data with the googlesheets4 package

```
# Once set up, you can automate this process by passing your email  
gs4_auth(email = "avamariehoffman@gmail.com")
```

Reading data with the googlesheets4 package

You can also supply an authorization token directly, but make sure never to make these visible online!

```
library(googledrive)
drive_auth(email= "<email>",
           token = readRDS("google-sheets-token.rds")) # Saved in a file
```

Reading data with the googlesheets4 package

Read in using `read_sheet()`

```
sheet_url <-  
  "https://docs.google.com/spreadsheets/d/1U6Cf_qE0hiR9AZqTqS3mbMF3zt2db48ZP5v3rkrAEJY/edit#gid=780868077"  
sheet_dat_1 <- read_sheet(sheet_url)
```

✓ Reading from "gapminder".

✓ Range 'Africa'.

```
head(sheet_dat_1)
```

```
# A tibble: 6 × 6  
  country continent  year lifeExp      pop gdpPercap  
  <chr>    <chr>    <dbl>   <dbl>   <dbl>   <dbl>  
1 Algeria Africa    1952    43.1  9279525    2449.  
2 Algeria Africa    1957    45.7 10270856    3014.  
3 Algeria Africa    1962    48.3 11000948    2551.  
4 Algeria Africa    1967    51.4 12760499    3247.  
5 Algeria Africa    1972    54.5 14760787    4183.  
6 Algeria Africa    1977    58.0 17152804    4910.
```

Reading data with the googlesheets4 package

Specify the sheet name if necessary:

```
sheet_dat_oceania <- read_sheet(sheet_url, sheet = "Oceania")
```

✓ Reading from "gapminder".

✓ Range "'Oceania'".

```
head(sheet_dat_oceania)
```

```
# A tibble: 6 × 6
  country    continent  year lifeExp      pop gdpPercap
  <chr>      <chr>    <dbl>  <dbl>    <dbl>    <dbl>
1 Australia Oceania   1952   69.1  8691212  10040.
2 Australia Oceania   1957   70.3  9712569  10950.
3 Australia Oceania   1962   70.9 10794968  12217.
4 Australia Oceania   1967   71.1 11872264  14526.
5 Australia Oceania   1972   71.9 13177000  16789.
6 Australia Oceania   1977   73.5 14074100  18334.
```

Pull in a subset of data: rows

```
read_sheet(sheet_url, sheet = "Oceania", range = cell_rows(1:4))
```

✓ Reading from "gapminder".

✓ Range "'Oceania'!1:4'.

```
# A tibble: 3 × 6
  country    continent  year lifeExp      pop gdpPercap
  <chr>      <chr>      <dbl>  <dbl>    <dbl>    <dbl>
1 Australia Oceania    1952   69.1  8691212  10040.
2 Australia Oceania    1957   70.3  9712569  10950.
3 Australia Oceania    1962   70.9 10794968  12217.
```

Pull in a subset of data: columns

```
read_sheet(sheet_url, sheet = "Oceania", range = cell_cols("A:B"))
```

✓ Reading from "gapminder".

✓ Range "'Oceania'!A:B".

```
# A tibble: 24 × 2
  country    continent
  <chr>      <chr>
1 Australia Oceania
2 Australia Oceania
3 Australia Oceania
4 Australia Oceania
5 Australia Oceania
6 Australia Oceania
7 Australia Oceania
8 Australia Oceania
9 Australia Oceania
10 Australia Oceania
# i 14 more rows
```

Reading data with the googlesheets4 package

List out the sheet names using `sheet_names()`.

```
sheet_names(sheet_url)
```

```
[1] "Africa"    "Americas" "Asia"      "Europe"    "Oceania"
```

Reading data with the googlesheets4 package

Iterate through the sheet names with `purrr`:

```
gapminder_sheets <- sheet_names(sheet_url)
data_list <- map(gapminder_sheets, ~ read_sheet(sheet_url, sheet = .x))
```

- ✓ Reading from "gapminder".
- ✓ Range "'Africa'".
- ✓ Reading from "gapminder".
- ✓ Range "'Americas'".
- ✓ Reading from "gapminder".
- ✓ Range "'Asia'".
- ✓ Reading from "gapminder".
- ✓ Range "'Europe'".
- ✓ Reading from "gapminder".
- ✓ Range "'Oceania'".

Reading data with the googlesheets4 package

Check out the list:

```
str(data_list)
```

List of 5

```

```

Reading data with the googlesheets4 package

Pull out sheets as needed:

```
data_list[[{sheet}]]  
# OR  
data_list %>% pluck({sheet})  
# OR (if named)  
data_list${sheet}
```

Writing data with the googlesheets4 package

```
sheet_dat_oceania <- data_list[[5]]  
  
sheet_dat_oceania <- sheet_dat_oceania %>%  
  mutate(lifeExp_days = lifeExp * 365)  
  
sheet_out <- gs4_create("Oceania-days",  
                        sheets = list(oceania_days = sheet_dat_oceania))
```

✓ Creating new Sheet: "Oceania-days".

```
# Opens a browser window  
gs4_browse(sheet_out)
```

Append data with the googlesheets4 package

```
sheet_append(sheet_out, data = sheet_dat_oceania, sheet = "Oceania_days")
```

- ✓ Writing to "Oceania-days".
- ✓ Appending 24 rows to 'Oceania_days'.

JSON: JavaScript Object Notation

Lists of stuff

Example [\[edit \]](#)

The following example shows a possible JSON representation describing a person.

```
{
  "firstName": "John",
  "lastName": "Smith",
  "isAlive": true,
  "age": 27,
  "address": {
    "streetAddress": "21 2nd Street",
    "city": "New York",
    "state": "NY",
    "postalCode": "10021-3100"
  },
  "phoneNumbers": [
    {
      "type": "home",
      "number": "212 555-1234"
    },
    {
      "type": "office",
      "number": "646 555-4567"
    }
  ],
  "children": [],
  "spouse": null
}
```

Why JSON matters

The screenshot shows the GitHub REST API reference page for the search endpoint. The left sidebar contains a navigation menu with various GitHub features. The main content area displays the 'Default response' for the search endpoint, which is a JSON object. The response indicates a status of 200 OK and contains a list of search results. The first result is for the 'classes.js' file in the 'jquery' repository.

BROW BEAT

An Art Exhibit You Can Visit Without Leaving Your Couch

The creators of the Whitney Museum's *New York Apartment* explain how they combined thousands of listings into a website for one massive, \$43.9 billion dwelling.

BY RACHELLE HAMPTON

APRIL 02, 2020 • 7:30 AM

NEW YORK APARTMENT

FOR SALE

\$43,869,676,331

65,764 bedrooms

55,588 bathrooms

36,672,535 sq ft

Are you constantly frustrated with seeing the same low-grade renovations and design choices in townhouses?

Are you in love with you-we?

Are you looking for a charming well-priced 1 Bedroom home in a sought-after area?

Are you looking for a very, elegant home closer to all that is held dear to a New Yorker?

Are you looking for a deal?

Are you looking for a great investment home?

Are you looking for a full-like open space with both light, view, and luxury condo services?

Are you looking for Beautiful Open Views?

Are you looking for that House that is in your Price Range, is DETACHED, has 3 Bedrooms, 4 Bathrooms, One Garage, & a Yard all in the Prime Bay Section of Staten Island with Water View & NOT in a FLOOD ZONE surrounded by Million Dollar Homes?

Are you looking for that perfect balance of convenience and security?

Are you looking for the perfect primary residence, find a home or investment property?

Are you looking to do a Lease or Rent to Own Home?

ABSTRACT

COVID-2019 has been recognized as a global threat, and several studies are being conducted in order to contribute to the fight and prevention of this pandemic. This work presents a scholarly production dataset focused on COVID-19, providing an overview of scientific research activities, making it possible to identify countries, scientists and research groups most active in this task force to combat the coronavirus disease. The dataset is composed of 40,212 records of articles' metadata collected from Scopus, PubMed, arXiv and bioRxiv databases from January 2019 to July 2020. Those data were extracted by using the techniques of Python Web Scraping and preprocessed with Pandas Data Wrangling. In addition,

Someone scraped 40,000 Tinder selfies to make a facial dataset for AI experiments

Natasha Lomas @riptari / 7:21 PM EDT • April 28, 2017

Comment

Tinder users have many motives for uploading their likeness to the dating app. But contributing a facial biometric to a downloadable data set for training convolutional neural networks probably wasn't top of their list when they signed up to swipe.

A user of Kaggle, a platform for machine learning and data science competitions which was [recently acquired by Google](#), has uploaded a facial data set he says was created by exploiting Tinder's API to scrape 40,000 profile photos from Bay Area users of the dating app — 20,000 apiece from profiles of each gender.

The data set, called [People of Tinder](#), consists of six downloadable zip files, with four containing around 10,000 profile photos each and two files with sample sets of around 500 images per gender.

Some users have had multiple photos scraped from their profiles, so there is likely a lot fewer

Entrez Programming Utilities Help

Bethesda (MD): [National Center for Biotechnology Information \(US\)](#); 2010-.

[Copyright and Permissions](#)

Introduction to the E-utilities

-  [E-utilities Introduction](#)
- Please see the [Release Notes](#) for details and changes.

The Entrez Programming Utilities (E-utilities) are a set of eight server-side programs that provide a stable interface into the Entrez query and database system at the National Center for Biotechnology Information (NCBI). The E-utilities use a fixed URL syntax that translates a standard set of input parameters into the values necessary for various NCBI software components to search for and retrieve the requested data. The E-utilities are therefore the structured interface to the Entrez system, which currently includes 38 databases covering a variety of biomedical data, including nucleotide and protein sequences, gene records, three-dimensional molecular structures, and the biomedical literature.

Step 0: Did someone do this already

<https://ropensci.org/packages/>

The screenshot shows the rOpenSci Packages website. The header is blue with the rOpenSci logo and navigation links: About, Blog, Projects, Packages, Community, and Resources. The main heading is "rOpenSci Packages" with the subtitle "All of our packages in one place". A search bar contains the text "api" and a "Search" button. Below the search bar are three tabs: "Active" (selected), "Experimental", and "Archived". To the right of the tabs, it says "Showing 10 of 101". The list of packages includes:

Package Name	CRAN	Peer-reviewed	Maintainer	Action
patentsview	Yes	Yes	Christopher Baker	+
rcrossref	Yes	Staff maintained	Scott Chamberlain	+
rcites	Yes	Yes	Kevin Cazelles	+

Step 0: Did someone do this already

`tidycensus` package: <https://walker-data.com/tidycensus/articles/basic-usage.html>

tidycensus 1.0.0.9000

[Home](#) [Reference](#) [Articles](#) [Changelog](#)

tidycensus

tidycensus is an R package that allows users to interface with the US Census Bureau's decennial Census and five-year American Community APIs and return tidyverse-ready data frames, optionally with simple feature geometry included. Install from CRAN with the following command:

```
install.packages("tidycensus")
```

tidycensus is designed to help R users get Census data that is pre-prepared for exploration within the **tidyverse**, and optionally spatially with **sf**. To learn more about how the package works, please read through the following articles:

- [Basic usage of tidycensus](#)
- [Spatial data in tidycensus](#)
- [Margins of error in the ACS](#)
- [Other Census Bureau datasets](#)
- [Working with Census microdata](#)

Future development

To keep up with on-going development of **tidycensus** and get even more examples of how to use the package, subscribe to the Walker Data email list below. You'll also get updates on the forthcoming CRC Press book *Analyzing the US Census with R*, which will cover a wide range of Census data analysis applications.

While **tidycensus** focuses on a select number of US Census Bureau datasets, there are many others available via the Census Bureau API. For access to all of these APIs, please check out Hannah Recht's excellent [censusapi package](#).
