

Data Wrangling in R

<http://sisbid.github.io/Data-Wrangling/>

Course Info

Course name	Data Wrangling in R
Instructors	<u>Carrie Wright</u> and <u>Ava Hoffman</u>
Course website	<u>http://sisbid.github.io/Data-Wrangling/</u>
Goals	Teach you how to get and clean data
Pre-reqs	Hopefully some R programming

Slack is helpful for:

- Getting help
- Talking with peers
- Accessing recordings

What we will cover in this course:

- 1) Why data wrangling is important?
- 2) Importing data (and outporting)
- 3) Subsetting data
- 4) Summarizing data
- 5) Cleaning data
- 6) Reshaping data
- 7) Data merging and joining
- 8) Functional programming (efficiently applying functions)
- 9) Working with factors, strings, dates
- 10) Version control - Git/GitHub

But first, some jargon!

Packages

A bundle or “package” of code (and or possibly data) that can be loaded together for easy repeated use or for sharing with others.

Packages are analogous to a software application like Microsoft Word on your computer.

Function

A piece of code that allows you to do something in R. Packages often contain functions.

You can think of a function as verb in R.

A function might help you add numbers together, create a plot, or organize your data. More on that soon!

```
sum(1, 20234)
```

```
[1] 20235
```

Argument

Something you pass to a function

```
round(0.627, digits = 2)
```

```
[1] 0.63
```

An Object

Something that can be worked with or on in R - can be lots of different things!

You can think of an objects as a noun in R.

An object might be a data table, a plot, a function or more!

Tree	age	circumference
1	118	30
1	484	58
1	664	87
1	1004	115
1	1231	120
1	1372	142
1	1582	145
2	118	33

Dataframes/DataTables/Spreadsheets

		Rows			
Columns					

Dataframes/Data tables

Rows = samples - individuals, locations, houses, viruses etc.

Columns = variables - aspects or features measured, color, count, type etc.

```
head(iris)
```

	Sepal.Length	Sepal.Width	Petal.Length	Petal.Width	Species
1	5.1	3.5	1.4	0.2	setosa
2	4.9	3.0	1.4	0.2	setosa
3	4.7	3.2	1.3	0.2	setosa
4	4.6	3.1	1.5	0.2	setosa
5	5.0	3.6	1.4	0.2	setosa
6	5.4	3.9	1.7	0.4	setosa

Need more help?

About us

Carrie

Ava

Carrie Wright is a Senior Staff Scientist at the [Fred Hutchinson Cancer Research Center](#) and an affiliated faculty member at the [Johns Hopkins Bloomberg School of Public Health \(JHSPH\)](#).

Dr. Wright's work is focused on innovating ways to make data science and computational biology more accessible. She is passionate about helping scientists, researchers, nonprofit organizations, and others utilize these skills to advance science, medicine, and social justice. She is a member of the [Open Case Studies](#) team, the [Genomic Data Science Community Network \(GDSCN\)](#), and the [Informatics Technology for Cancer Research \(ITCR\) Training Network \(ITN\)](#). She also currently serves as chair of the [ITCR OPEN Group](#).

Previously, Dr. Wright was an Assistant Scientist in the Department of [Biostatistics](#) at the [Johns Hopkins Bloomberg School of Public Health \(JHSPH\)](#) and a member of the [Johns Hopkins Data Science Lab \(DaSL\)](#).

Prior to joining the JHSPH, Dr. Wright was a Postdoctoral Fellow at the [Lieber Institute for Brain Development \(LIBD\)](#), where her research focused on uncovering genetic mechanisms in psychiatric disease (with a particular emphasis on non-coding RNA) through the utilization of data science tools. At LIBD, Dr. Wright co-founded the [LIBD rstats club](#), a community designed to encourage others to learn more about R programming and statistics. Dr. Wright has also served as an instructor for the [Baltimore Underground Science Space](#) and the [Johns Hopkins Center for Talented Youth](#).

Open Case Studies

What is the Open Case Studies (OCS) project?

The Open Case Studies project is an educational resource that educators can use in the classroom to teach students how to effectively derive knowledge from data in real-world challenges.

AVA HOFFMAN

BALTIMORE, USA · AVAMARIEHOFFMAN @ GMAIL.COM

Hi! 🖐️

I'm a data scientist and ecologist. I'm currently exploring ways to make genomics research more accessible by connecting communities to cloud-based resources. I get really excited about things at the intersection of ecology and data, like population genetics and statistical modeling in nature. Lately, I've been especially interested in how plants evolve in man-made ecosystems (cities!) and how we can link those findings to public health outcomes.

I like coding, climbing things, everything DIY, and taking stuff apart to see how it works. I'm also working to get a community upcycling collective called **Bed Roll Baltimore** going!

Dataset Error:

Data Errors are One of the Leading Causes of Retractions

In the case of Kufner et al.'s study on the smoking paradox in ischemic stroke patients, the authors acknowledged a significant error in their dataset labeling. This error led to a gross misrepresentation of the number of individuals who had received intra-arterial thrombolysis treatment, undermining the validity of the study's main conclusion. This example underscores the need for meticulous data representation and cleaning in research, highlighting the potential implications of errors and, in the occurrence of errors, the need for adequate conduct, even as it showcases a good example of authors owning their mishaps and shedding light on them ([Kufner et al., 2022](#)).

The smoking paradox in ischemic stroke patients treated with intra-arterial thrombolysis in combination with mechanical thrombectomy–VISTA-Endovascular

⚠ Retraction

After this article [1] was published, the authors became aware of a dataset error that renders the article's conclusions invalid.

Specifically, due to data labelling and missing information issues, the 'IAT' data reflect intra-arterial (IA) treatment rather than the more restricted treatment type of IA-thrombolysis. Further investigation of the dataset revealed that only 24 individuals in the study population received IA-thrombolysis, instead of N = 216 as was reported in [1]. Hence, the article's main conclusion is not valid or reliable as it is based on the wrong data.

Furthermore, due to the small size of the IA-thrombolysis-positive group, the dataset is not sufficiently powered to address the research question.

In light of the above concerns, the authors retract this article.

All authors agree with retraction.

Using *in vitro* drug sensitivity data coupled with Affymetrix microarray data, we developed gene expression signatures that predict sensitivity to individual chemotherapeutic drugs. Each signature was validated with response data from an independent set of cell line studies. We further show that many of these signatures can accurately predict clinical response in individuals treated with these drugs. Notably, signatures developed to predict response to individual agents, when combined, could also predict response to multidrug regimens. Finally, we integrated the chemotherapy response signatures with signatures of oncogenic pathway deregulation to identify new therapeutic

Individual Researchers

Anil Potti's misbehavior is at the center of the case. Prior to ORI's conclusion of research misconduct, Joseph Nevins and Robert Califf had both said that it is highly likely that Potti intentionally fabricated or falsified data ([CBS News, 2012](#)). In addition, Baggerly, Coombes, and Wang had documented many instances of sloppy or careless data analysis, and Perez documented use of unreliable predictors and omission of data not showing desired results. The negative impact of such sloppy and careless practices on the ability to replicate results and ultimately on patient care might be similar to the impact of fabrication or falsification.

BIRS Workshop, Aug 14, 2013

DATA PIPELINE

The design and analysis of a successful study has many stages, all of which need policing.

- Most of the attention is on the last step
- This course is about all the steps that come before
- They are **critical** for getting things right

Reproducibility/Transparency is
Important

“We report the challenges confronted during a large-scale effort to replicate findings in cancer biology, and describe how improving **transparency and sharing** can make it easier to assess rigor and replicability and, therefore, to **increase research efficiency.**”

**Reproducibility saves
everyone time and effort!**

Now Ruby

Ruby's code

Future Ruby

Ruby's code

It saves your future self time and effort!

Your closest collaborator is
you six months ago, but you
don't reply to emails

- Karl Broman

http://kbroman.org/Tools4RR/assets/lectures/06_org_eda.pdf

Ruby's code - **not as reproducible**

It saves the time & effort of others!

Ruby's code - **more reproducible**

A useable, well-documented analysis is more likely to be used and disseminated!

It improves trust and reuse!

⚠ Reproducibility $\neq$ Correctness ⚠

Reproducibility $\sim$ Consistency

You could be consistently
wrong in the same way....

However, being consistent and transparent is a necessary step for doing trustworthy science.

It makes it easier for you and others to determine if your work was correct.

Reproducible work is typically easier to update!

Reviewer 2:
Please redo your full analysis but
change this one detail.

And so we data wrangle

Raw & processed data

“Data are values of qualitative or quantitative variables, belonging to a set of items.”

“Data are values of qualitative or quantitative variables, belonging to a set of items.”

Set of items: Sometimes called the population; the set of objects you are interested in

“Data are values of qualitative or quantitative **variables**, belonging to a set of items.”

Variables: A measurement or characteristic of an item

“Data are values of **qualitative** or **quantitative** variables, belonging to a set of items.”

Qualitative: Country of origin, sex, treatment

Quantitative: Height, weight, blood pressure

Data sharing

1. The raw data.
2. A tidy data set
3. A code book describing each variable and its values in the tidy data set.
4. An explicit and exact recipe you used to go from 1 -> 2,3

Tidy Data

Hadley Wickham
RStudio

<https://twitter.com/hadleywickham>

Abstract

A huge amount of effort is spent cleaning data to get it ready for analysis, but there has been little research on how to make data cleaning as easy and effective as possible. This paper tackles a small, but important, component of data cleaning: data tidying. Tidy datasets are easy to manipulate, model and visualise, and have a specific structure: each variable is a column, each observation is a row, and each type of observational unit is a table. This framework makes it easy to tidy messy datasets because only a small set of tools are needed to deal with a wide range of un-tidy datasets. This structure also makes it easier to develop tidy tools for data analysis, tools that both input and output tidy datasets. The advantages of a consistent data structure and matching tools are demonstrated with a case study free from mundane data manipulation chores.

A tidy data set

```

R/Python Code
Input raw data -> output tidy
No parameters

Rules for Tidy Spreadsheets

1. Be consistent
2. Choose good names for things
3. Write dates as YYYY-MM-DD
4. No empty cells
5. Put just one thing in a cell
6. Don't use font color or highlighting as data
7. Save the data as plain text files

Just no

<http://www.phdcomics.com/comics/archive.php?comiciid=1531>

<https://xkcd.com/1459/>

When..	Be sure to...	So Do this...	Avoid this...	Why?
Naming variables (aka assigning column headers)	Use meaningful variable names	`AgeAtDiagnosis`	`ADx`	`ADx` is an unclear and uninformative abbreviation
Naming variables	Avoid spacing in column headers	`AgeAtDiagnosis`	`Age At Diagnosis`	Spacing in variable names makes the analyst's life more difficult
Naming variables	Use consistent capitalization	`AgeAtDiagnosis`	Using both `AgeAtDiagnosis` and `ageatdiagnosis`	Using consistent column names across tables/spreadsheets simplifies any merging the statistician may have to do.
Naming variables	Avoid using separators, but if it's necessary, use an underscore (`_`)	`IGF1` (or `IGF_1`)	`IGF.1`, `IGF-1`, `IGF/1`, `IGF,1`	Separators (commas, periods, hyphens, slashes, spaces etc.) often have different meanings in coding languages than they do in text. Avoiding them avoids error.
Coding variables	Avoid unnecessary spaces	`male`	`male `	That extra space after `male ` makes it different from `male` without a space.
Coding variables	Be consistent!	`male`	`Male`,`male`, and `M`	In the eyes of the statistician, `Male`,`male`, and `M` could be incorrectly perceived as three different values.
Coding variables	Be careful of spelling errors	`male`	`maale`	That extra `a` makes these two different categories.
Coding date and time	Use ISO 8601 coding	`YYYY-MM-DD`	`MM/DD/YY` and `Month Day, Year`	Consistency simplifies the analyst's life, and YYYY-MM-DD will not be misconstrued if opened in Excel.
Coding missing data	Not leave any cells blank and use a consistent value	`NA`	`0`, `-9`, red-highlighted blank cells, `.`; `.`; ...	Each cell should be filled with a consistent value. Pick a way to denote missingness (ideally `NA`) and stick with it. Avoid using numbers or punctuation to denote missing data.
Entering data	Stick to text and numbers	Convey all information with direct text/numerical entry	Using cell highlighting or font color to convey information	Your analyst may not use the same platform for analysis as you used for data entry, so avoiding font color and cell highlighting will minimize issues.
Generating an Excel file	Save the data in an appropriate format	Use one worksheet per table and save as CSV or text files	Multiple worksheets	Statisticians require this format to import your data onto other platforms.
Entering Data	Avoid entering unnecessary lines of text at the start	Start your first row with variable names	Adding lines of text	This violates the rules of tidy data and makes processing more difficult. Include this information in the "Code book" instead.
Opening files in Excel	Know and avoid its pitfalls	Consistently include one value per cell and be careful of date and time data.	Using macros, splitting cells, and merging cells	These formats are not amenable to data analysis on other platforms.

Key principles of file naming for data science projects:

- Machine readable
- Human readable
- Be nicely ordered

Bad Naming	Good Naming

Which one is better?

05-21-2017-analysis-cust001.R

or

2017-05-21-analysis-cust001.R?

Structure of a filename

processed_pvalue_data_from_pubmed_oct24.rda

What did I do to this data

`processed_pvalue_data_from_pubmed_oct24.rda`

What kind of data is this?

processed_pvalue_data_from_pubmed_oct24.rda

Where did it come from?

processed_pvalue_data_from_pubmed_oct24.rda

When did I get it?

processed_pvalue_data_from_pubmed_oct24.rda

Underscores/slashes not dots/whitespace

processed_pvalue_data_from_pubmed_oct24.rda

Consistency is the main rule

processed_pvalue_data_from_pubmed_oct24.rda
raw_pvalue_data_from_pubmed_oct24.rda

Organize thyself

Reproducibility is a tortoise's game - it's an incremental and slow process *but* **it has high payoffs!**

Reproducibility is iterative work!

Documentation that every project should have!

1. READMEs

AI can help, but check everything!

- a. Background knowledge
- b. Usage info
- c. Software requirements to run the thing
- d. Basics on how the files are organized

2. Code annotations:

- a. Explain historical decisions
- b. Explain “quirks” of the code
- c. Say where more development is needed (TODO)
- d. Summarize the goals!

This is the README file for my_first_project

Last updated: 02-Mar-2018

The folders in this project are:

- *data* - is the folder where you can find all the collected data.
- *figures* - is where you can find all the plots, data pictures, and other images.
- *code* - is where you can find code files for collecting, cleaning up, or analyzing data.
- *products* - is where you can find reports, presentations, or products

Data on crime is obtained from International Crime Data collected between 2015-2018 and is publicly available. Data on happiness is collected from the Survey of International Happiness.

ALLERGIES		MEDICATION HISTORY	
Last Updated: 01 Dec 2011 @ 0851		Last Updated: 11 Apr 2011 @ 1737	
Allergy Name:	TRIMETHOPRIM	Medication:	AMLODIPINE BESYLATE 10MG TAB
Location:	DAYT29	Instructions:	TAKE ONE TABLET BY MOUTH TAKE ONE-HALF TABLET FOR GRAPEFRUIT JUICE--
Date Entered:	09 Mar 2011	Status:	Active
Reaction:		Refills Remaining:	3
Allergy Type:	DRUG	Last Filled On:	20 Aug 2010
Drug Class:	ANTI-INFECTIVES,OTHER	Initially Ordered On:	13 Aug 2010
Observed/Historical:	HISTORICAL	Quantity:	45
Comments:	The reaction to this allergy was MILD (NO SQUELAE)	Days Supply:	90
		Pharmacy:	DAYTON
		Prescription Number:	2718953
Allergy Name:	TRAMADOL	Medication:	IBUPROFEN 600MG TAB
Location:	DAYT29	Instructions:	TAKE ONE TABLET BY MOUTH FOUR TIMES A DAY WITH FOOD
Date Entered:	09 Mar 2011	Status:	Active
Reaction:	URINARY RETENTION	Refills Remaining:	3
Allergy Type:	DRUG	Last Filled On:	20 Aug 2010
Drug Class:	NON-OPIOD ANALGESICS	Initially Ordered On:	01 Jul 2010
Observed/Historical:	HISTORICAL	Quantity:	300
Comments:	gradually worsening difficulty emptying bladder		

Processed data

- Processed data should be named so it is easy to see which script generated the data.
- The processing script - processed data mapping should occur in the README
- Processed data should be tidy

Hidden Pane

To save a copy of your code. You must open a file first - this will open a 4th pane. These files include Scripts or what are called R Markdown files.

Hidden Pane

Nice! now we have a place to save code! This is where we will mostly be working.

R Markdown file

R Markdown files (.Rmd) help generate reports that include your code and output.

1. Helps you describe your code
2. Allows you to check the output
3. Can create many different file types

Nice report!

This generates a nice report that you can share with others who can open in any browser.

The screenshot shows a web browser window displaying an R Markdown report. The browser's address bar shows the file path: `~/Documents/Roger/New_Folder/Untitled.html`. The report content includes a title, a date, a section header, an introductory paragraph about R Markdown, a code chunk for `summary(cars)`, and its corresponding output table.

Untitled

Your Name
2023-03-29

R Markdown

This is an R Markdown document. Markdown is a simple formatting syntax for authoring HTML, PDF, and MS Word documents. For more details on using R Markdown see <http://rmarkdown.rstudio.com>.

When you click the **Knit** button a document will be generated that includes both content as well as the output of any embedded R code chunks within the document. You can embed an R code chunk like this:

```
summary(cars)
```

##	speed	dist
## Min.	: 4.0	Min. : 2.00
## 1st Qu.:	12.0	1st Qu.: 26.00
## Median :	15.0	Median : 36.00
## Mean :	15.4	Mean : 42.98
## 3rd Qu.:	19.0	3rd Qu.: 56.00
## Max.	: 25.0	Max. : 120.00

Including Plots

Summary

- Repeatable → Reproducible → Replicable
- Others know what you did well enough to use your data and code and get the same results
- Reproducibility:
 - Helps Make science more efficient!
 - Helps your future self and others know what you did
 - Saving time and effort
 - Makes it easier to adjust or update your work
- **Reproducible does not mean correct!** But it is a good first step to help identify if your work is correct
- Organizing files, naming files consistently and informatively helps! R Markdown files do too - more about that next!
